

# Constellations Wordsearch

Constellations are groups of stars. Look at the constellations on StarDisc. Have you got any favourites? Why? Because of their shapes? Because of their names? Or because of something you know about them?

Looking at the StarDisc constellations will help you to learn the constellation shapes and identify them in the night sky.

### What's More...

In 1930, Belgian astronomer Eugène Joseph Delporte drew up the boundaries between constellations that astronomers still use today. That means that every bit of the sky falls within one of the 88 modern constellations and cannot be within more than one constellation.
