

We Are Stardust

Our planet and everything in it are all made of stardust!

Every single thing there is, is made of elements that have already been part of a star.

Mountains, oceans, trees, whales, penguins, pineapples and people – all of us are made of bits of exploded stars, combined together in new ways.

Use this space to draw your own new combinations of elements to create a new kind of life or new kind of planet. Who knows? Maybe it's already out there somewhere.

What's More...

The crucial elements for life on earth are often called the building blocks of life. **CHNOPS** – carbon, hydrogen, nitrogen, oxygen, phosphorous and sulphur. Humans and our galaxy have about 97% of the same kinds of atoms. All the important ones for life show up more and more the nearer you get to the middle (or origin) of the galaxy.
